This project was built by the instructions of Kevin Powell, Build a Space Travel Website course on Scrimba. The design of the web page is completely his idea. This project is a vanilla JS and mostly CSS project on the Scrimba education site.

In this case Angular framework was used to create the project work it changed several solutions in the building methods. The Crew page was only mentioned but the lessons did not have complex details to build that page and the Destination page was completely Homework.

This project focuses mainly to the design. It has some HTTP requests from the database because the sliders get the information from a database and Angular methods like ngFor handle the data.

This site has no user features it is only a landing page of a fictive “commercial space travel agency”.
